

RF IC Selection Guide

ADI's RF IC Portfolio Covers Entire RF Signal Chain

Using a unique combination of design skills, system understanding, and process technologies, Analog Devices offers the broadest portfolio of RF ICs covering the entire RF signal chain, from industry-leading high performance RF function blocks to highly integrated ISM band and wideband single-chip transceiver solutions. The RF function blocks include DDS and PLL synthesizers; TruPwr™ RMS power detectors and logarithmic amplifiers; X-Amp® VGAs; power amplifiers, LNAs, and other RF amplifiers, mixers, and direct conversion modulator and demodulator products. These products are supported by a wide range of free design tools to ease the development of RF systems. For more information, visit: www.analog.com/RF.

Attenuators/VGAs/Filters

Features

- Broad portfolio of RF and IF variable gain control products for communications, instrumentation, and military applications
- Includes continuous analog linear-in-dB products based on X-Amp interpolation architectures and digital step controlled products providing as fine as 0.25 dB step and linear-in-volts digital control
- Offers innovative integration with digitally controlled multi-pole analog filters integrated within the VGA and single-chip AGC circuits for automatic level control

Detectors

Features

- Market leading detectors; industry's largest portfolio
- Continuous production since 1999; proven high volume supplier
- Industry's first patented RF true power RMS detectors
- Best-in-class frequency range, temperature stability, and operating temperature range
- Single-ended input, no external balun or tuning required

Integrated Transceivers, Transmitters, and Receivers

Features

- Best-in-class performance and significant BOM savings
- Full portfolio of ISM band devices optimized for applications such as smart grid/ smart meters, point-to-point, and more
- Complete system-on-a-chip, highly integrated RF/IF transceivers for wireless applications including UMTS femtocell base stations, WiMAX, and LTE femtocell and picocell base stations

Mixers/Multipliers

Features

- High linearity active mixers provide conversion gain
- Broadband portfolio with operation up to 6 GHz
- Integrated LO driver on-chip and IF amplifier
- Small footprint packages, single supply

Modulators/Demodulators

Features

- Variety of high performance quadrature modulators and demodulators for operation at frequencies up to 6 GHz
- Offers a combination of high performance, broadband operating frequency, and flexible device architecture
- Ideal for a wide range of wireless infrastructure applications, including 2G, 2.5G, 3G and 4G cellular base station radios, high-capacity point-to-point and point-to-multipoint radio links, wireless LAN and wireless local loop equipment

Prescalers (Microwave)

Features

- Divide by 2, 4, or 8 options
- Integrated RF decoupling capacitors
- Low power consumption: active mode at 30 mA and power down mode at 7 mA
- Low phase noise at -150 dBc/Hz
- Single dc supply that is $+3$ V compatible with ADI's extensive offering of PLLs

RF Switches

Features

- Highly integrated solution for low cost portable wireless systems
- Low insertion loss, high isolation between ports, low distortion, and low current consumption
- CMOS design and built-in drivers for TTL compatibility
- Integrated drivers
- Low IDD for portable applications
- Improved ESD performance
- Low-pass filter performance
- Increased power handling using dc bias

Timing ICs and Clocks

Features

- Low phase noise clock generation with multioutput distribution at subpicosecond jitter levels
- Integrated components: PLL, VCO, dividers, delays, clock drivers
- Precision network clock synchronization with holdover/switchover
- Complete timing solutions for networks, clocking converters, and base stations

RF Design Tools

As the industry's only supplier of all major RF-to-digital functional building blocks that extend from antenna to processor, Analog Devices supports its broad RF IC portfolio with a comprehensive suite of design tools. RF system design is an extremely complex and time-consuming process, and the company's design tools reduce your design risk and time-to-market by making the overall RF-to-digital design process simpler, faster, more accurate, and more robust. Reduce risk and ease your RF systems development by downloading your copy of these free tools now! Visit www.analog.com/rftools.

ADIsimRF™

ADI's ADIsimRF™ design tool provides calculations for the most important parameters within the RF signal chain, including cascaded gain, noise figure, IP3, P1dB, and total power consumption. Download a copy now at: www.analog.com/adisimrf.

ADIsimPLL™

ADIsimPLL™ enables the rapid and reliable evaluation of new high performance PLL products from ADI. It is the most comprehensive PLL synthesizer design and simulation tool available today. Simulations performed include all key nonlinear effects that are significant in affecting PLL performance. ADIsimPLL removes at least one iteration from the design process, thereby speeding the design-to-market. Download a copy now at www.analog.com/adisimpll.

ADIsimSRD™ Design Studio

ADIsimSRD™ Design Studio is a very powerful tool that enables real-time simulation and optimization of many of the parameters in a typical wireless system using the ADF7xxx family of short range transceivers and transmitters. The tool allows users to view modulation in both the time and frequency domains. Furthermore, the ADIsimSRD Design Studio greatly simplifies the overall development process by creating a path along which a user can be guided and breaking down the design workflow into a number of distinct tasks. Download a copy now at www.analog.com/adisimsrd.

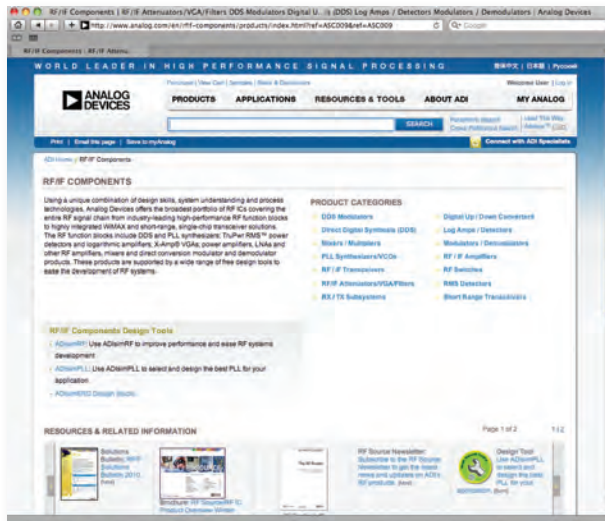

ADIsimCLK™

ADIsimCLK™ is the design tool developed specifically for Analog Devices' range of ultralow jitter clock distribution and clock generation products. Whether your application is in wireless infrastructure, instrumentation, networking, broadband, ATE, or other areas demanding predictable clock performance, ADIsimCLK will enable you to rapidly develop, evaluate, and optimize your design. ADIsimCLK is extremely user friendly and easy to use. ADIsimCLK allows the designer to work at a higher level and directly modify parameters such as the loop bandwidth, divide ratios, phase offsets, and output frequencies—and the effects of the changes on performance are shown instantly (without burning fingers with a soldering iron!). With traditional design techniques, the evaluation of new devices requires construction, measurement, and hand optimization of a prototype, which is a significant barrier to change and is often a key reason for the continual use of 'old' clock distribution chips.
